                    <h2>About us</h2>

                    <p>Agriculture is the most important sector in today's life. Most plants
are affected by a wide variety of bacterial and fungal diseases. Diseases on
plants placed a major constraint on the production and a major threat to food
security. Hence, early and accurate identification of plant diseases is essential to
ensure high quantity and best quality. In recent years, the number of diseases on
plants and the degree of harm caused has increased due to the variation in
pathogen varieties, changes in cultivation methods, and inadequate plant
protection techniques.

An automated system is introduced to identify different diseases on plants by
checking the symptoms shown on the leaves of the plant. Deep learning
techniques are used to identify the diseases and suggest the precautions that can
be taken for those diseases. </p>
